20. Different stages in wastewater treatment.

- 1) Primary treatment / Physical Treatment
- 2) Secondary treatment / Biological treatment
- 3) Tertiary treatment / Chemical treatment.

1) Primary treatment / Physical Treatment of waste water

In the primary treatment of waste water, large particles are removed from the waste water which will otherwise clog and disrupt the treatment process.

Screening :- Screens are used to remove physical particles, which are big like logs, plastics, etc. Waste water is first passed through the screens to remove these unwanted particles which will be then moved to landfill.

Grit Chambers :- Wastewater then is passed to the Grit chamber. Here, solid substances and small stones, sands are removed. These particles are called Grit, and after the removal of Grit, it is passed to the next step of wastewater treatment.

Sedimentation (settling tank) :- Wastewater is then passed into sedimentation (settling tank). Here, the smallest particles are settled down in the tank, which is sludge, and the floating materials like oils, grease are also
